

AN UPPER BOUND FOR THE HEIGHT FOR REGULAR AFFINE AUTOMORPHISMS OF $\mathbb{A}^n$

CHONG GYU LEE

ABSTRACT. In [6], Kawaguchi proved a lower bound for height of $h(f(P))$ when f is a regular affine automorphism of $\mathbb{A}^2$, and he conjectured that a similar estimate is also true for regular affine automorphisms of $\mathbb{A}^n$ for $n \geq 3$. In this paper we prove Kawaguchi's conjecture. This implies that Kawaguchi's theory of canonical heights for regular affine automorphisms of projective space is true in all dimensions.

1. INTRODUCTION

Let ζ be a rational map on $\mathbb{P}^n$ and $Z(\zeta)$ be the indeterminacy locus of ζ . We will say that a family of rational maps $\{\zeta_i\}$ is jointly regular if $\bigcap Z(\zeta_i)$ is empty. Silverman [14] proved the following result for jointly regular maps.

Theorem 1.1. *If $\zeta_1, \dots, \zeta_m : \mathbb{P}^n \rightarrow \mathbb{P}^n$ is a family of jointly regular maps, then*

$$\sum_{i=1}^m \frac{1}{d_i} h(\zeta_i(P)) \geq h(P) - C,$$

where d_i be the degree of ζ_i , and the constant C is independent of the point P .

In special cases, we can improve the bound. Suppose that

$$f : \mathbb{A}^n \rightarrow \mathbb{A}^n$$

is an affine automorphism with inverse function f^{-1} . Since $\mathbb{A}^n$ is a dense subset of $\mathbb{P}^n$, we can find ϕ_0 and ψ_0 , rational functions that extend f and f^{-1} ,

$$\begin{array}{ccccc} \mathbb{P}^n & \xleftarrow{\psi_0} & \mathbb{P}^n & \xrightarrow{\phi_0} & \mathbb{P}^n \\ | & & | & & | \\ \mathbb{A}^n & \xleftarrow{f^{-1}} & \mathbb{A}^n & \xrightarrow{f} & \mathbb{A}^n \end{array}$$

We say f is a regular affine automorphism if $\{\phi_0, \psi_0\}$ is jointly regular. Kawaguchi showed in [6] that Silverman's result can be improved when we have a regular affine automorphism of $\mathbb{A}^2$.

Theorem 1.2. *Let f be a regular affine automorphism on $\mathbb{A}^2$. Then,*

$$\frac{1}{\deg f} h(f(P)) + \frac{1}{\deg f^{-1}} h(f^{-1}(P)) > \left(1 + \frac{1}{\deg f \deg f^{-1}}\right) h(P) + C$$

Key words and phrases. regular affine automorphism, height, Kawaguchi's conjecture.

Kawaguchi conjectured that Theorem 1.2 is true for regular affine automorphisms of $\mathbb{A}^n$ for all $n \geq 2$. In this paper we prove Kawaguchi's conjecture. From now on, we will let H be the hyperplane at infinity, f and f^{-1} an affine automorphism and its inverse, and ϕ_0 and ψ_0 morphisms that are meromorphic extensions of f and f^{-1} . By $Z(\zeta)$ we will mean the indeterminacy locus of the rational map ζ .

Acknowledgements. The author would like to thank Joseph H. Silverman for his advice and Dan Abramovich for his assistance, in particular with the proof of Lemma 3.4.

2. RESOLVING INDETERMINACY AND THE ESSENTIAL DIVISOR OF ϕ

As a standard application of blowing up subschemes, we know that for any rational map $f : \mathbb{P}^n \rightarrow \mathbb{P}^n$, there is a blowup V of $\mathbb{P}^n$ and a birational morphism $\pi : V \rightarrow \mathbb{P}^n$ such that $f \circ \pi$ is a morphism. In general, not all birational morphism are decomposed into monoidal transformations (blowing up along closed subvarieties). Fortunately, we have Hironaka's theorem on resolution of indeterminacy.

Theorem 2.1. *Let $\zeta : V \rightarrow W$ be a rational map between smooth proper varieties. Then there is a sequence of varieties V_i such that:*

- (1) V_i is a blowup of V_{i-1} along a smooth irreducible subvariety.
- (2) The meromorphic extension ζ_r of f on V_r is a morphism.

Proof. [4, Main Theorem II, Corollary 3] □

Definition 2.2. *We call a birational map $\pi : X \rightarrow Y$ a monoidal transformation if X is a blowup of Y whose center is a subvariety.*

Definition 2.3. *Let $\pi : W \rightarrow V$ be a birational morphism with center the scheme whose ideal sheaf is $\mathfrak{I}$, and let D be an irreducible divisor on V . We define the proper transformation of D to be*

$$\overline{\pi^{-1}(D \cap U)},$$

where $U = V \setminus Z(\mathfrak{I})$, and where $Z(\mathfrak{I})$ is the underlying subvariety that is the zero set of the ideal $\mathfrak{I}$.

We now assume that $V_0, \dots, V_k$ is a sequence of varieties as in Theorem 2.1 which resolves the indeterminacy of ϕ_0 . We let $V = V_k$, we write $\pi_V : V \rightarrow \mathbb{P}^n$ for the birational morphism that is a composition of monoidal transformations, and we let $\phi = \phi_0 \circ \pi_V : V \rightarrow \mathbb{P}^n$ be the morphism extending ϕ_0 . We prove a lemma describing the Picard group of V .

Lemma 2.4. *With notation as above, let $H_V \in \text{Div}(V)$ be the proper transform in V of H , and for each $1 \leq i \leq k$, let $E_i \in \text{Div}(V)$ be the proper transform in V of the exceptional divisor of the monoidal transformation $V_i \rightarrow V_{i-1}$. Then*

$$\text{Pic}(V) = \mathbb{Z}H_V \oplus \mathbb{Z}E_1 \oplus \mathbb{Z}E_2 \oplus \dots \oplus \mathbb{Z}E_k.$$

In other words, $\text{Pic}(V)$ is a free abelian group of rank $k + 1$ generated by H_V and $E_1, \dots, E_k$.

Proof. Let $\pi : \tilde{X} \rightarrow X$ be the blowup of a smooth variety along a smooth subvariety and let E denotes the exceptional divisor of the blowup. Then it is well known that $\text{Pic}(\tilde{X}) = \pi^* \text{Pic}(X) \oplus \mathbb{Z}E$; see for example [3, II.8.Ex 5]. Applying this fact repeatedly, starting from $V_0 = \mathbb{P}^n$ and $\text{Pic}(V_0) = \mathbb{Z}H$, an easy induction gives the desired result. $\square$

Similarly, for f^{-1} , we let $W = W_l$ be a variety which resolves the indeterminacy of ψ_0 , we let $\pi_W : W \rightarrow \mathbb{P}^n$ be a birational morphism that is a composition of monoidal transformations, we write $\psi = \psi_0 \circ \pi_W : W \rightarrow \mathbb{P}^n$ for the morphism extending ψ , and we let

$$\text{Pic}(W) = \mathbb{Z}H_W \oplus \mathbb{Z}F_1 \oplus \mathbb{Z}F_2 \oplus \cdots \oplus \mathbb{Z}F_l,$$

where $H_W \in \text{Div}(W)$ is the proper transform in W of H , and for each $1 \leq j \leq l$, let $F_j \in \text{Div}(W)$ be the proper transform in W of the exceptional divisor of the monoidal transformation $W_j \rightarrow W_{j-1}$.

This is summarized in the following commutative diagrams.

$$\begin{array}{ccc} V = V_k & , & W = W_l \\ \downarrow \pi_V & & \downarrow \pi_W \\ V_i & & W_j \\ \downarrow \phi_i & \searrow \phi = \phi_k & \downarrow \psi_j \\ \mathbb{P}^n & \dashrightarrow & \mathbb{P}^n \\ \phi_0 & & \psi_0 \end{array}$$

Here are some lemmas which will help us to define the essential divisor and to prove Kawaguchi's conjecture in section 3.

Lemma 2.5.

$$\phi_0(H \setminus Z(\phi_0)) \subset Z(\psi_0).$$

Proof. Let

$$\phi_0 = (X_0^d, F_1, \dots, F_n), \quad \psi_0 = (X_0^e, G_1, \dots, G_n).$$

Then using the fact that ϕ_0 and ψ_0 are inverse maps, we have

$$\psi_0 \circ \phi_0 = \left(X_0^{de}, G_1(X_0^d, F_1, \dots, F_n), \dots \right) = \left(X_0^{de}, X_0^{de-1}X_1, \dots, X_0^{de-1}X_n \right).$$

Now let $P = [0, x_1, \dots, x_n] \in H \setminus Z(\phi_0)$. Then,

$$\psi_0(\phi_0(P)) = (0, G_1(\phi_0(P)), \dots) = (0^{de}, 0^{de-1}X_1, \dots, 0^{de-1}X_n),$$

and hence $\phi_0(P) \in Z(\psi_0)$. $\square$

Lemma 2.6.

$$\phi_* \phi^* H = H.$$

Proof. For this proof, we let H , H_V and E_i be specific closed subvarieties of codimension 1, not linear equivalence classes. Let C_i are the image of E_i by ϕ . Since ϕ is an automorphism on

$$\mathbb{A}^n \cong V \setminus \left(H_V \cup \left(\bigcup_{i=1}^k E_i \right) \right) \cong \mathbb{P}^n \setminus H,$$

the C_i are algebraic subsets of H . So we can choose a hyperplane H' which does not contain any of the C_i . Let H'^V be the preimage of H' by ϕ . Then, H'^V does not contain any of E_i . It also

means that the $H'^V \cap E_i$ always has codimension larger than 1, since E_i is irreducible. And the codimension of $H'^V \cap H_V$ is also larger than 1. So,

$$\overline{\phi \left(H'^V \cap \left(H_V \cup \left(\bigcup_{i=1}^k E_i \right) \right) \right)}.$$

is a closed cycle of codimension larger than 1, since ϕ_* is a graded group homomorphism. Therefore,

$$\begin{aligned} \phi_*(H'^V) &= [K(H'^V) : K(\phi(H'^V))] \cdot \overline{\phi(H'^V)} \\ &= [K(H'^V) : K(\phi(H'^V))] \cdot \overline{\phi \left(H'^V \setminus \left(H_V \cup \bigcup_{i=1}^k E_i \right) \right)}. \end{aligned}$$

Moreover, since ϕ is one-to-one outside of H_V and E_i ,

$$[K(H'^V) : K(\phi(H'^V))] = 1 \quad \text{and} \quad \phi \left(H'^V \cap \left(H_V \cup \bigcup_{i=1}^k E_i \right) \right) = H' \setminus H.$$

Therefore, $\phi_*\phi^*H' = H'$, and hence $\phi_*\phi^*H = \phi_*\phi^*H' = H' = H$. $\square$

Lemma 2.7.

$$\phi(H_V) \subset H \quad \text{and} \quad \phi(E_i) \subset H.$$

Proof. Suppose that there is a point $Q \in H_V \cup (\bigcup_i E_i)$ such that $\phi(Q) \in \mathbb{A}^n = \mathbb{P}^n \setminus H$. Then, since $Z(\psi_0) \subset H$, $\phi(Q) \notin Z(\psi_0)$, and hence $\psi_0(\phi(Q)) \in \mathbb{A}^n$.

We now consider some rational maps. Let $\phi : V \dashrightarrow W$ and $\tilde{\psi} : W \dashrightarrow V$ be rational maps that extend ϕ and ψ , and let ζ be the composition of $\tilde{\psi}$ and $\tilde{\phi}$.

$$\begin{array}{ccccc} & & \zeta & & \\ & \swarrow & & \searrow & \\ V & \xrightarrow{\tilde{\phi}} & W & \xrightarrow{\tilde{\psi}} & V \\ \pi_V \downarrow & \searrow \phi & \downarrow \pi_W & \swarrow \psi & \downarrow \pi_V \\ \mathbb{P}^n & \xrightarrow{\phi_0} & \mathbb{P}^n & \xrightarrow{\psi_0} & \mathbb{P}^n \\ \downarrow & & \downarrow & & \downarrow \\ \mathbb{A}^n & \xrightarrow{f} & \mathbb{A}^n & \xrightarrow{f^{-1}} & \mathbb{A}^n \\ & \swarrow & & \searrow & \\ & f^{-1} \circ f = id_{\mathbb{A}^n} & & & \end{array}$$

It is clear that $\psi_0 \circ \phi = \pi_V \circ \zeta$ where they are defined. Further, $\zeta : V \dashrightarrow V$ is a rational map which satisfies

$$(\pi_V \circ \zeta \circ \pi_V^{-1})|_{\mathbb{A}^n} = f^{-1} \circ f = id_{\mathbb{A}^n}.$$

But we have a trivial extended morphism $id_V : V \rightarrow V$ which also satisfies

$$(\pi_V \circ id_V \circ \pi_V^{-1})|_{\mathbb{A}^n} = id_{\mathbb{A}^n},$$

so that $\zeta = id_V$. Therefore,

$$\psi_0 \circ \phi(Q) = \pi_V \circ \zeta(Q) = \pi_V(Q) \in H,$$

which contradicts the assumption. $\square$

Lemma 2.8. Write ϕ^*H in terms of the basis for $\text{Pic}(V)$, say

$$\phi^*H = b_0H_V + \sum_{i=1}^k b_iE_i.$$

Then $b_i > 0$ for all i .

Proof. Let u be a uniformizer for the hyperplane H at infinity,

$$u(x_0, \dots, x_n) = x_0.$$

Then by definition,

$$\phi^*H = \text{ord}_{H_V}(u \circ \phi) \cdot H_V + \sum \text{ord}_{E_i}(u \circ \phi) \cdot E_i.$$

Furthermore, $u = 0$ on H because it is a uniformizer of H , while $\phi(E_i) \subset H$ and $\phi(H_V) \subset H$ by Lemma 2.7. Therefore,

$$u \circ \phi = 0$$

on H_V and on E_i , and hence $\text{ord}_{H_V}(u \circ \phi) \geq 1$ and $\text{ord}_{E_i}(u \circ \phi) \geq 1$. $\square$

Theorem 2.9. Write

$$\phi^*H = b_0H_V + \sum_{i=1}^k b_iE_i$$

as in Lemma 2.8. Then there exists a unique index $t \neq 0$ such that

$$b_t = 1, \quad \phi_*E_t = H \quad \text{and} \quad \phi_*E_j = 0 \quad \text{for all } j \neq t.$$

Proof. It is clear that ϕ_*H_V and ϕ_*E_i are nonnegative multiples of H , since $\text{Pic}(\mathbb{P}^n) = \mathbb{Z}$. So we may write $\phi_*E_i = s_iH$ with $s_i \geq 0$. For any irreducible divisor D , the definition of ϕ_*D is

$$[K(D) : K(\phi(D))] \cdot \overline{\phi(D)}.$$

From this definition, we get

$$(1) \quad \phi_*H_V = 0,$$

because $\phi_0(H \setminus Z(\phi_0)) \subset Z(\psi_0)$ from Lemma 2.5, and $Z(\psi_0)$ has codimension greater than 1. Furthermore, since $\phi_*\phi^*H = H$ from Lemma 2.6, we have

$$H = \phi_*\phi^*H = \phi_* \left(aH_V + \sum_{i=1}^k b_iE_i \right) = \sum_{i=1}^k b_i\phi_*E_i = \sum_{i=1}^k b_is_iH.$$

Lemma 2.8 says that $b_j > 0$ for all j , and also $s_i \geq 0$ for all i . Therefore there is exactly one t satisfying $s_tb_t = 1$, and $s_jb_j = 0$ for all $j \neq t$. Then the fact that every $b_j > 0$ implies that $s_j = 0$ for all $j \neq t$. Finally, since s_t and b_t are non-negative integers, the equality $s_tb_t = 1$ implies that $s_t = b_t = 1$. $\square$

Definition 2.10. Let E_t be the unique exceptional divisor satisfying $\phi_*E_t = H$ as described in Theorem 2.9. We call E_t the essential exceptional divisor of ϕ .

3. PROOF OF KAWAGUCHI'S CONJECTURE

Theorem 3.1. *Let f be a regular affine automorphism of $\mathbb{A}^n$. Then there is a constant $C = C(f)$ such that for all $P \in \mathbb{A}^n$,*

$$\frac{1}{\deg f} h(f(P)) + \frac{1}{\deg f^{-1}} h(f^{-1}(P)) \geq \left(1 + \frac{1}{\deg f \deg f^{-1}}\right) h(P) + C.$$

We recall an important definition.

Definition 3.2. *Let $D \in \text{Pic}(X)$. We say that D is numerically effective if*

$$D^r \cdot Y \geq 0$$

for all $r \geq 1$ and all integral subschemes $Y \subset X$ of dimension r .

Proposition 3.3. *Let $\zeta : X \rightarrow X'$ be a morphism of projective varieties, and let $D \in \text{Pic}(X')$ be numerically effective. Then ζ^*D is also numerically effective.*

Proof. This is a standard result, see for example [9, Example 1.4.4(i)], but for the readers convenience, we provide the short proof. From the projection property of intersection,

$$\begin{aligned} (\zeta^*D)^r \cdot Y' &= \zeta^*D \cdot ((\zeta^*D)^{r-1} \cdot Y') = \zeta^* [D \cdot \zeta_* \{(\zeta^*D)^{r-1} \cdot Y'\}] \\ &= \zeta^* [D \cdot D \cdot \zeta_* \{(\zeta^*D)^{r-2} \cdot Y'\}] = \dots = D^r \cdot \zeta_* Y'. \end{aligned}$$

Since $\dim(\zeta_* Y') = r$ and D is numerically effective, this last intersection is nonnegative. $\square$

An important ingredient in the proof of Theorem 3.1 is a result that describes the pullback of the pushforward of a numerically effective divisor.

Lemma 3.4. *Let $\rho : \tilde{X} \rightarrow X$ be a birational morphism and let Z be an divisor on $\tilde{X}$ that is both effective and numerically effective. Then $\rho^* \rho_* Z \geq Z$.*

Proof. Let Z be an effective and numerically effective divisor, and let

$$\text{Pic}(V) = \langle D_1, \dots, D_r \rangle$$

be a generating set for $\text{Pic}(V)$, where the D_i are effective divisor of V . Then we can find a generating set

$$\text{Pic}(W) = \langle D_1^\#, \dots, D_r^\#, F_1, \dots, F_s \rangle,$$

where $D_i^\#$ is the proper transformation of D_i , and where the F_i are exceptional divisors of the birational morphism ρ . We write the pull-back of D_i as

$$\rho^* D_i = D_i^\# + \sum_j m_{ij} F_j.$$

This allows us to write the given divisor Z as

$$\begin{aligned} Z &= \sum_i a_i D_i^\# + \sum_j b_j F_j \\ &= \sum_i a_i \left(\rho^* D_i + \sum_j m_{ij} F_j \right) + \sum_j b_j F_j \\ &= \sum_i a_i \rho^* D_i + \sum_j f_j F_j, \end{aligned}$$

where each f_j is some expression involving the b_j and m_{ij} . Further, and this is a key point, the fact that Z is numerically effective implies that $f_j \leq 0$ for all j . This follows from [7, Lemma 2.19].

We now compute

$$\begin{aligned} \rho^* \rho_* Z &= \sum_i a_i \rho^* \rho_* \rho^* D_i + \sum_j f_j \rho^* \rho_* F_j \\ &= \sum_i a_i \rho^* D_i \quad \text{since } \rho_* \rho^* D_i = D_i \text{ and } \rho_* F_j = 0. \end{aligned}$$

Hence

$$\rho^* \rho_* Z - Z = - \sum_j f_j F_j = \sum_j (-f_j) F_j \geq 0$$

is effective. □

We recall that we have the following diagram of maps,

$$\begin{array}{ccc} V & & \\ \pi_V \downarrow & \searrow \phi & \\ \mathbb{P}^n & \xrightarrow[\phi_0]{} & \mathbb{P}^n \end{array}$$

For notational convenience, we let

$$d = \deg(f) \quad \text{and} \quad d' = \deg(f^{-1}).$$

Lemma 3.5. *Let E_t be the essential divisor of ϕ . Then the pull-backs of H by π_V and ϕ have the form*

$$\pi_V^* H = H_V + d' E_t + \sum_{i \neq t} a_i E_i, \quad \phi^* H = d H_V + E_t + \sum_{i \neq t} b_i E_i,$$

where the coefficients of the non-essential exceptional divisors satisfy

$$d' b_i \geq a_i \geq 0 \quad \text{for all } i \neq t.$$

Proof of Lemma 3.5. Let

$$\pi_V^* H = a_0 H_V + \sum_{i=1}^k a_i E_i \quad \text{and} \quad \phi^* H = b_0 H_V + \sum_{i=1}^k b_i E_i,$$

Clearly $\pi_{V*} \pi_V^* H = H$ by Lemma 2.6, and $\pi_{V*} E_i = 0$ because $\pi_V(E_i) \subset Z(\phi_0)$. So,

$$H = \pi_{V*} \pi_V^* H = \pi_{V*} \left(a_0 H_V + \sum_{i=1}^k a_i E_i \right) = \pi_{V*} (a_0 H_V) = a_0 H,$$

and hence $a_0 = 1$. And we have $b_t = 1$ by the definition of the essential exceptional divisor.

Next we compute b_0 and a_t . Letting u be a uniformizer at H , we have by definition

$$\phi^* H = \text{ord}_{H_V}(u \circ \phi) \cdot H_V + \sum_{i=1}^k \text{ord}_{E_i}(u \circ \phi) \cdot E_i.$$

Taking the push-forward of $\phi^* H$ by π_V , we get

$$\pi_{V*} \phi^* H = \text{ord}_{H_V}(u \circ \phi) \cdot \pi_{V*} H_V + \sum_{i=1}^k \text{ord}_{E_i}(u \circ \phi) \cdot \pi_{V*} E_i = \text{ord}_{H_V}(u \circ \phi) \cdot H_V,$$

since we showed

$$\pi_{V*}H_V = H \quad \text{and} \quad \pi_{V*}E_i = 0.$$

Furthermore, because $\phi = \phi_0 \circ \pi_V$ and $\phi_0 = [x_0^d, f_1, \dots, f_n]$, we have

$$\text{ord}_{H_V}(u \circ \phi) = \text{ord}_H(u \circ \phi \circ \pi_V^{-1}) = \text{ord}_H(u \circ \phi_0) = d.$$

On the other hand,

$$\pi_{V*}\phi^*H = \pi_{V*}\left(b_0H_V + \sum_{i=1}^k b_iE_i\right) = b_0\pi_{V*}(H_V) + \sum_{i=1}^k b_i\pi_{V*}(E_i) = b_0H,$$

and hence $b_0 = d$.

Similarly,

$$\pi_V^*H = \text{ord}_{H_V}(u \circ \pi_V) \cdot H_V + \sum_{i=1}^k \text{ord}_{E_i}(u \circ \pi_V) \cdot E_i,$$

and

$$\phi_*\pi_V^*H = \text{ord}_{H_V}(u \circ \pi_V) \cdot \phi_*H_V + \sum_{i=1}^k \text{ord}_{E_i}(u \circ \pi_V) \cdot \phi_*E_i = \text{ord}_{E_t}(u \circ \phi) \cdot H,$$

since

$$\phi_*H_V = 0, \quad \phi_*E_t = H \quad \text{and} \quad \phi_*E_j = 0 \quad \text{for all } j \neq t.$$

Furthermore, because

$$\pi_V = \psi_0 \circ \phi \quad \text{ord}_{E_t}(u \circ \phi) = b_V = 1, \quad \text{and} \quad \phi_0 = [x_0^{d'}, g_1, \dots, g_n],$$

we have

$$\text{ord}_{E_t}(u \circ \pi_V) = \text{ord}_{E_t}(u \circ \psi_0 \circ \phi) = \text{ord}_H(u \circ \psi_0) = d'.$$

On the other hand,

$$\phi_*\pi_V^*H = \phi_*\left(a_0H_V + \sum_{i=1}^k a_iE_i\right) = a_0\phi_*H_V + \sum_{i=1}^k a_i\phi_*E_i = a_tH,$$

and hence $a_t = d'$.

It is clear that all of the a_i and b_i are non-negative, since H is effective and H_V and the E_i are the divisors whose support is contained in $\pi_V^{-1}(H)$ and $\phi^{-1}(H)$. It remains to prove the inequality $d'b_i \geq a_i$. We apply Lemma 3.4 to the divisor π_V^*H , which is both effective and numerically effective, and to the map ϕ_V . Lemma 3.4 tells us that

$$\phi_V^*\phi_{V*}(\pi_V^*(H)) \geq \pi_V^*(H).$$

We also have

$$\begin{aligned} \phi_{V*}\pi_V^*(H) &= \phi_{V*}\left(H_V + d'E_t + \sum_{i \neq t} a_iE_i\right) && \text{from above,} \\ &= d'H && \text{from Theorem 2.9.} \end{aligned}$$

(Note that $\phi_*E_i = 0$ for $i \neq t$ by the definition of the essential divisor, and we have already seen in (1) that $\phi_{V*}H_V = 0$.) Hence

$$\phi_V^*(d'H) = \phi_V^*(\phi_{V*}\pi_V^*(H)) \geq \pi_V^*(H).$$

Using the expressions for $\phi_V^*(H)$ and $\pi_V^*(H)$ from above, this inequality gives

$$d' \left(dH_V + E_t + \sum_{i \neq t} a_i E_i \right) \geq H_V + d' E_t + \sum_{i \neq t} b_i E_i.$$

A little bit of algebra yields

$$(dd' - 1)H_V + \sum_{i \neq t} (d'a_i - b_i)E_i \geq 0.$$

Then the following lemma shows that $d'a_i \geq b_i$ for all $i \neq t$. □

Lemma 3.6. *The divisor*

$$c_0 H_V + \sum_{i \neq t} c_i E_i \in \text{Div}(V)$$

is linearly equivalent to an effective divisor if and only if $c_i \geq 0$ for all $i \neq t$.

Proof. One direction is obvious. For the other, suppose that

$$c_0 H_V + \sum_{i \neq t} c_i E_i \sim n_0 H_V + \sum_i n_i E_i + \sum_j m_j D_j,$$

where $n_i \geq 0$ and $m_j \geq 0$, and where the D_j are irreducible divisors distinct from H_V and the E_i . Note that the D_j have the property that $\pi_* D_j$ has nontrivial intersection with $\mathbb{A}^n$, since H_V is the proper transform of $H = \mathbb{P}^n \setminus \mathbb{A}^n$ and the E_i are the exceptional divisors of the blowup $\pi : V \rightarrow \mathbb{P}^n$. Then the fact that ϕ_0 is an automorphism of $\mathbb{A}^n$ implies that $\phi_* D_j \neq 0$. Hence there are positive integers k_j such that $\phi_* D_j \sim k_j H$.

We know from before that $\phi_* H_V = 0$ and $\phi_* E_i = 0$ for $i \neq t$, and also $\phi_* E_t = H$. Therefore

$$0 = \phi_* \left(c_0 H_V + \sum_{i \neq t} c_i E_i \right) = n_t \phi_* E_t + \sum_j m_j \phi_* D_j \sim n_t H + \sum_j m_j k_j H.$$

Here $n_t \geq 0$, $m_j \geq 0$, and $k_j > 0$, and $\text{Pic}(\mathbb{P}^n) = \mathbb{Z}$, so we conclude that $n_t = 0$ and $m_j = 0$ for all j .

This proves that

$$c_0 H_V + \sum_{i \neq t} c_i E_i \sim n_0 H_V + \sum_{i \neq t} n_i E_i.$$

Lemma 2.4 says that H_V and the E_i are linearly independent in $\text{Pic}(V)$, so $c_i = n_i \geq 0$ for all i . □

Proof of Theorem 3.1. To ease notation, we let $E_V = E_t$ be the essential divisor, and we define

$$M_V = \sum_{i \neq t} a_i E_i \quad \text{and} \quad I_V = \sum_{i \neq t} b_i E_i.$$

Then Lemma 3.4 can be rewritten as

$$\pi_V^* H = H_V + d' E_V + M_V, \quad \phi^* H = d H_V + E_V + I_V,$$

where $M_V, I_V \geq 0$ and $d' I_V \geq M_V$. Further, the supports of I_V and M_V do not contain the support of H_V or E_V .

Now do the same with a blowup that resolves the indeterminacy of ψ_0 ,

$$\begin{array}{ccc} & W & \\ \psi \swarrow & \downarrow \pi_W & \\ \mathbb{P}^n & \xleftarrow{\psi_0} & \mathbb{P}^n \end{array}$$

Since ψ_0 is the extension of the affine automorphism f^{-1} to $\mathbb{P}^n$, we have using similar notation,

$$\pi_W^* H = H_W + d' F_W + N_W, \quad \psi^* H = d H_W + E_W + J_W,$$

with $J_W, N_W \geq 0$ and $dJ_W \geq N_W$. Here F_W is the essential divisor of ψ , and N_W and J_W are $\mathbb{A}^n$ -effective divisors whose supports do not contain the support of H_W or F_W .

Now, consider a blowup U of $\mathbb{P}^n$ that resolves both ϕ_0 and ψ_0 . The assumption that f is regular implies that the centers of the blowups V and W are disjoint, so U is a blowup of $\mathbb{P}^n$ whose center is the scheme-theoretic sum of the centers of the blowups V and W . We have the following diagram:

$$\begin{array}{ccccc} & & U & & \\ \psi_U \swarrow & & \downarrow \pi_U & & \searrow \phi_U \\ \psi \swarrow W & & \pi_W \searrow & & \pi_V \swarrow V \searrow \phi \\ \mathbb{P}^n & \xleftarrow{\psi_0} & \mathbb{P}^n & \xrightarrow{\phi_0} & \mathbb{P}^n \end{array}$$

Let H_U be the proper transformation of H by $\pi_U : U \rightarrow \mathbb{P}^n$, and let E, M, I, F, N, J be the proper transformations of $E_V, M_V, I_V, F_W, N_W, J_W$, respectively. Then we have

$$\begin{aligned} \pi_U^* H &= H_U + d' E + dF + M + N, \\ \phi_U^* H &= d(H_U + dF + N) + E + I, \\ \psi_U^* H &= d'(H_U + d' E + M) + F + J. \end{aligned}$$

Finally, we compute the divisor

$$\begin{aligned} D &= \frac{1}{d} \phi_U^* H + \frac{1}{d'} \psi_U^* H - \left(1 + \frac{1}{dd'}\right) \pi_U^* H \\ &= (H_U + dF + N) + \frac{1}{d}(E + I) + (H_U + d' E + M) + \frac{1}{d'}(F + J) \\ &\quad - \left(1 + \frac{1}{dd'}\right) (H_U + d' E + dF + M + N) \\ &= \left(1 - \frac{1}{dd'}\right) H_U + \frac{1}{dd'}(dJ - N + d'I - M). \end{aligned}$$

The fact that $d'I > M$ and $dJ > N$ implies that D is effective, which completes the proof of Theorem 3.1. $\square$

4. CANONICAL HEIGHT FUNCTIONS FOR REGULAR AFFINE AUTOMORPHISM

In Sections 4 and 5 of [6], Kawaguchi constructed canonical heights for regular affine automorphisms under the assumption that his height lower bound conjecture was true. Since we have proved his conjecture, his construction of canonical heights, as described in the following theorem, is now valid in all dimensions.

Theorem 4.1. *Let $f : \mathbb{A}^n \rightarrow \mathbb{A}^n$ be an affine automorphism of degree d and f^{-1} be its inverse map of degree d' . Define*

$$\widehat{h}_+(P) = \limsup \frac{1}{d^l} h(f^n(P)), \quad \widehat{h}_-(P) = \limsup \frac{1}{d'^l} (h(f^{-1})^n(P))$$

and

$$\widehat{h}(P) = \widehat{h}_+(P) - \widehat{h}_-(P)$$

Then,

$$\frac{1}{d} \widehat{h}(f(P)) + \frac{1}{d'} \widehat{h}(f^{-1}(P)) = \left(1 + \frac{1}{dd'}\right) \widehat{h}(P)$$

and $\widehat{h}(P) = 0$ if and only if P is f -periodic.

5. AN EXAMPLE

An example of a Hénon map on $\mathbb{A}^n$, which is the regular affine automorphism, is

$$f(x_1, \dots, x_n) = (x_2, x_3 + x_2^2, x_4 + x_3^2, \dots, x_n + x_{n-1}^2, x_1 + x_n^2).$$

On $\mathbb{A}^2$, properties of Hénon maps are well known, but less is known for Hénon maps on $\mathbb{A}^n$. In this section we describe what happens for a Hénon map of degree 2 on $\mathbb{A}^3$. Since the details of the proof are somewhat lengthy, we just give a sketch and refer the reader to [10] for details.

Let f be a Hénon map defined as

$$(x, y, z) = (y, z + y^2, x + z^2).$$

It's an affine automorphism with inverse

$$f^{-1} = (z - (y - x^2), x, y - x^2)$$

and meromorphic extensions

$$\begin{aligned} \phi_0([x, y, z, w]) &= [yw, zw + y^2, xw + z^2, w^2], \\ \psi_0([x, y, z, w]) &= [zw^3 - (yw - x^2), xw^3, yw^3 - x^2w^2, w^4]. \end{aligned}$$

The map f is regular, since the indeterminacy loci are $Z(\phi_0) = \{[1, 0, 0, 0]\}$ and $Z(\psi_0) = \{[0, y, z, 0]\}$.

After a number of blow-ups along subvarieties of dimension zero and one, and using intersection theory to compute relevant coefficients, we find that the resolution of f gives a map $\phi_V : V \rightarrow \mathbb{P}^3$ with

$$\begin{aligned} \pi_V^* H &= H + E_1 + 2E_2 + 2E_3 + 4E_4 + 4E_5, \\ \phi_V^* H &= 2H + E_1 + 2E_2 + E_3 + 2E_4 + E_5. \end{aligned}$$

Further, E_5 is the essential exceptional divisor. Similarly, resolving f^{-1} gives a map $\psi_W : W \rightarrow \mathbb{P}^3$ with

$$\begin{aligned} \pi_W^* (H) &= H + F_1 + 2F_2 + 2F_3 + 2F_4 + F_5 + 2F_6 + 2F_7, \\ \psi_W^* (H) &= 4H + 2F_1 + 4F_2 + 2F_3 + F_4 + F_5 + 2F_6 + F_7. \end{aligned}$$

Combining the two resolutions to form a single variety that resolves both f and f^{-1} yields

$$\begin{aligned} \pi^* H &= H + 4E_5 + 2F_7 + (E_1 + 2E_2 + 2E_3 + 4E_4) + (F_1 + 2F_2 + 2F_3 + F_5 + 2F_6 + 2F_7), \\ \phi^* H &= 2(H + 2F_7 + (F_1 + 2F_2 + 2F_3 + F_5 + 2F_6 + 2F_7)) + E_5 + (E_1 + 2E_2 + E_3 + 2E_4), \\ \psi^* H &= 4(H + 4E_5 + (E_1 + 2E_2 + 2E_3 + 4E_4)) + F_4 + (2F_1 + 4F_2 + 2F_3 + F_5 + 2F_6 + F_7), \end{aligned}$$

and hence

$$\begin{aligned} & \frac{1}{2}\phi^*H + \frac{1}{4}\psi^*H - \left(1 + \frac{1}{8}\right)\pi^*H \\ &= \frac{7}{8}H + \frac{3}{8}E_1 + \frac{3}{4}E_2 + \frac{1}{4}E_3 + \frac{1}{2}E_4 + 0E_5 + \frac{3}{8}F_1 + \frac{3}{4}F_2 + \frac{1}{4}F_3 + 0F_4 + \frac{1}{8}F_5 + \frac{1}{4}F_6 + 0F_7 \\ &\geq 0. \end{aligned}$$
